Introduction

Section 161.143 (5), Florida Statutes (F.S.) states: “*The Department shall update and maintain an annual report on its website concerning the extent to which each inlet project has succeeded in balancing the sediment budget of the inlet and adjacent beaches and in mitigating the inlet’s erosive effects on adjacent beaches. The report must estimate the quantity of sediment bypassed, transferred, or otherwise placed on adjacent eroding beaches, or in such beaches’ nearshore area, for the purpose of offsetting the erosive effects of inlets on the beaches of this state.*”

Elements of the Report:

The order of the annual inlet report is listed by region, starting with inlets in the Northeast Atlantic Coast Region, moving south along the east coast, then west to east through the Panhandle Region, and finally north to south along the Southwest Gulf Coast Region. One can view the table of contents to find a specific inlet. Elements of the annual inlet report include the inlet management plan’s (IMP) adoption year, IMP updated year, annual bypass numbers by year, bypass objective, annualized volume, cumulative volume, cumulative objective, surplus or deficit volume and the percentage of the bypass objective met. The report highlights the surplus and deficit of material that is being bypassed on an annual basis to each side of an inlet that is actively managed. The bypass objective is listed in the first table for each inlet and will state if the bypass objective is from the Strategic Beach Management Plan (SBMP). The IMP is based on sediment budgets developed through inlet studies, typically sponsored by local government entities. These studies are designed to determine the best strategies for mitigating the erosive effects of the altered inlet in order to bypass beach quality sand to the adjacent eroded beaches. All bypass data submitted to, or otherwise available to, the Department through 2025 was included. For some inlets, data may be incomplete or unavailable at the time of publication. Beach nourishment is another management strategy for Florida’s eroded beaches. Sand volumes associated with these projects can be found in the [Strategic Beach Management Plan](#). In some cases, beach nourishment projects adjacent to inlets have mitigated some or all of the inlet effects. [Inlet Management Plans](#) are available on the Department’s website. The Department and/or local governments sponsor inlet management studies and inlet reports, which can be viewed or downloaded from the [OCULUS folder](#) (use the Public Login tab to access the site).

A full listing of Florida's inlets (66) along the Atlantic Coast and Gulf Coast can be viewed in Table 1 through 4 of the Strategic Beach Management Plan's [Introduction](#), within the Florida Inlets section.

It should also be noted that the Department recognizes the language found in Section 161.142, F.S., regarding inlet sand bypassing activities and the historical sand deficits caused by inlets. The statute states: *"The Legislature recognizes the need for maintaining navigation inlets to promote commercial and recreational uses of our coastal waters and their resources. The Legislature further recognizes that inlets interrupt or alter the natural drift of beach-quality sand resources, which often results in these sand resources being deposited in nearshore areas or in the inlet channel, or in the inland waterway adjacent to the inlet, instead of providing natural nourishment to the adjacent eroding beaches. Accordingly, the Legislature finds it is in the public interest to replicate the natural drift of sand which is interrupted or altered by inlets to be replaced and for each level of government to undertake all reasonable efforts to maximize inlet sand bypassing to ensure that beach-quality sand is placed on adjacent eroding beaches. Such activities cannot make up for the historical sand deficits caused by inlets but shall be designed to balance the sediment budget of the inlet and adjacent beaches and extend the life of proximate beach-restoration projects so that periodic nourishment is needed less frequently. Therefore, in furtherance of this declaration of public policy and the Legislature's intent to redirect and recommit the state's comprehensive beach management efforts to address the beach erosion caused by inlets."*

The intent of Section 161.142, F.S., and the IMP strategies is to mitigate the contemporary inlet effects, not the historical effects of an inlet.

Northeast Atlantic Coast Region

Figure 1. St. Marys River Entrance inlet channel being dredged by the USACE to bypass material south to be placed on Ft. Clinch State Park shoreline. Photo taken by DEP staff. See additional [construction photos](#) of inlet sand bypassing projects.

St. Marys River Entrance

Table 1. St. Marys River Entrance Management Plan and bypass objective.

County	Inlet	Year IMP Adopted or Updated	Annual Bypass Objective North (CY)	Annual Bypass Objective South (CY)
Nassau	St. Marys River Entrance	1998	0	554,000

Table 2. St. Marys River Entrance summary of sand bypass volumes, since 1998.

Bypassing Matrix	North Bypass (CY)	South Bypass (CY)
Cumulative Volume Bypassed:	0	4,035,936
Cumulative Objective:	0	15,512,000
Annualized Volume Bypassed:	0	144,141
Surplus (Deficit):	0	-11,476,064
Percent Objective Met:	N/A	26.02%

St. Lucie Inlet

Table 13. St. Lucie Inlet - Inlet Management Plan and bypass objective.

County	Inlet	Year IMP Updated	Annual Bypass Objective North (CY)	Annual Bypass Objective South (CY)
Martin	St. Lucie-Original (1)	1995	0	0
Martin	St. Lucie-Updated (2)	2016*	34,000	161,000
Martin	St. Lucie-Updated (3)	2023	36,000	163,000

*Bypass objective of 185,000 cubic yards to the south was initially established in 2008 of SBMP and then updated in 2016.

Table 14. St. Lucie Inlet - Updated IMP bypass summary of sand bypass volumes, since 2016.

Bypassing Matrix	North Bypass (CY)*	South Bypass (CY)*
Cumulative Volume Bypassed:	414,000^	1,978,932
Cumulative Objective:	346,000	1,616,000
Annualized Volume Bypassed:	41,400	197,893
Surplus (Deficit):	68,000	363,932
Percent Objective Met:	119.65%	122.46%

*With the updated IMP in 2016, the accounting of bypassing and any surplus/deficits pre-2016 are not shown.

^The cumulative volume bypassed to the north does not include the beach nourishment volumes listed in the SBMP.

Between 2016 and 2025, north of St. Lucie Inlet, a total volume of 998,136 cubic yards of inlet dredging was conducted, with placement on Bathtub Beach and Sailfish Point between R34 and R40, of which 414,000 cubic yards has been credited by the Department as inlet bypassing. The remaining volume of 584,136 cubic yards is credited by the Department toward beach nourishment at Bathtub Beach and Sailfish Point.

South of the inlet, Martin County contributed funding to the Town of Jupiter Island's 2016 beach nourishment project, equivalent to 500,000 cubic yards, which was credited toward inlet bypassing. Maintenance dredging of the inlet was completed in August 2018 with placement of 512,411 cubic yards in the designated offshore borrow area. In 2019, Martin County again contributed funding to the town's beach nourishment project, equivalent to 531,593 cubic yards, which was credited toward inlet bypassing by the Department. In 2022, the county conducted maintenance dredging that bypassed 447,339 cubic yards from the inlet to the state park south of the inlet. This volume was credited toward inlet bypassing by the Department. In 2025, Martin County once again contributed funding to the town's beach nourishment project, equivalent to 500,000 cubic yards. This volume will be credited towards inlet bypassing by the Department in the 2026 Annual Inlet Report.

Stump Pass

Table 49. Stump Pass Inlet Management Plan and bypass objective.

County	Inlet	Year IMP Adopted or Updated	Annual Bypass Objective North (CY)	Annual Bypass Objective South (CY)
Charlotte	Stump Pass	2016	6,000	25,000

Table 50. Stump Pass Inlet bypass summary of sand bypass volumes, since 2016.

Bypassing Matrix	North Bypass (CY)	South Bypass (CY)
Cumulative Volume Bypassed:	144,000*	297,100
Cumulative Objective:	60,000	250,000
Annualized Volume Bypassed:	14,400	29,710
Surplus (Deficit):	102,000	47,100
Percent Objective Met:	240.00%	118.84%

*Cumulative volume to the north is based upon nourishment interval of eight years for bypassing and does not include beach nourishment volume listed in the SBMP.

Between 2016 and 2025, north of the inlet at Stump Pass, a total of 427,380 cubic yards of dredged material was placed on Manasota Key between R18 and R21. Of this, 144,000 cubic yards has been credited toward inlet bypassing. The remaining 283,380 cubic yards is credited by the Department toward beach nourishment at Manasota Key.

Between 2016 and 2025, there has been a total inlet dredge volume of 297,100 cubic yards at Stump Pass with approximate placement on the north end of Knight Island near R22; of which, the entire 297,100 cubic yards have been credited for inlet bypassing.

Figure 34. Stump Pass bypass volume, annual objective, cumulative volume and cumulative objective to the north.

Figure 35. Stump Pass bypass volume, annual objective, cumulative volume and cumulative objective to the south.

Redfish Pass

New Inlet Studies and New or Updated Inlet Management Plans

The Department, local governments and coastal engineering consultants continually work to conduct inlet studies that develop best management practices to bypass beach quality sand to adjacent eroding beaches with the goal of balancing the sediment budget, in accordance with the requirements of Section 161.142 F.S.

Recent plans (2024-2026), current studies or plans that are being drafted for years 2026 and 2027:

Recent Plans:

1. Mexico Beach Inlet has a new inlet management plan adopted in April 2024.
2. Pensacola Pass has a new inlet management plan adopted in August 2024.
3. Passage Key Inlet has a new inlet management plan adopted in November 2024.
4. Longboat Pass has a new inlet management plan adopted in December 2024.
5. Big Carlos Pass has a new inlet management plan adopted in October 2024.
6. New Pass (Lee County) has a new inlet management plan adopted in July 2025.
7. Jupiter Inlet has an updated inlet management plan adopted in July 2025.
8. New Pass (Sarasota County) has an inlet management plan adopted in November 2025.
9. Big Hickory Pass has updated inlet management plan adopted in June 2026.

New Plans:

1. Port Canaveral is expected to have an updated inlet management plan in winter 2026-27.

New Studies:

1. Hurricane Pass in Pinellas County has a new sediment budget/inlet study that is being conducted in 2026-27.
2. Boca Raton Inlet in Palm Beach County has a new sediment budget/inlet study that is being conducted in 2026-27.

Summary

Of the 66 inlets in the State of Florida, 46 are considered managed inlets as listed within the Strategic Beach Management Plan's Introduction. There are a total of 32 altered inlets with Department approved inlet management plans that are listed within the Annual Inlet Report. Please note that for the 32 inlets discussed in this report, there are collectively 41 inlet bypass objectives. (i.e., eight inlets have two bypass objectives (north and south), and two inlets have a monitoring-based objective in both directions and two more inlets with N/A due to being a brand new IMP with no previous bypassing through year 2025. Twenty inlets have a bypass objective of zero in one direction (usually to the north) that results in N/A for the percent objective met.

Within the sixth edition of the Annual Inlet Report; 22 of the 41 inlet bypass objectives are meeting their bypass objective at 100% or greater, 3 inlet bypass objectives are between 90% and 99%, one inlet bypass objective is between 71%, and 89%, 1 inlet bypass objective is between 60% and 70%, 6 inlet bypass objectives are below 49%, and 4 inlets have 8 bypass objectives that are classified as not applicable (N/A) due to 2 inlets with monitoring based objectives and two inlets have a new IMP), (Figure 43). In total, 54% of the inlets are above 100% in meeting their bypass objectives and 9% are between 71% and 100%. The Annual Inlet Report assists the Department, local governments and inlet entities in tracking and providing accountability in how well inlet management activities are meeting the bypass objective listed in their respective inlet management plans.

Figure 43. Summary pie chart of the 32 altered inlets that are listed within the annual inlet report showing the percentage of meeting their inlet bypass objectives.
